

Polarization: Physical orientation of the electric field

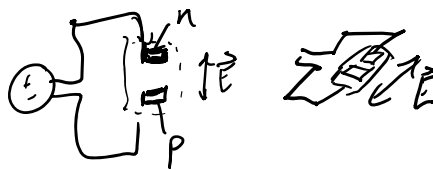

Radio antenna

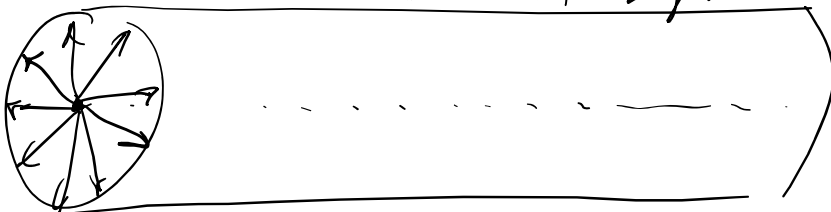

half-Dipole wave

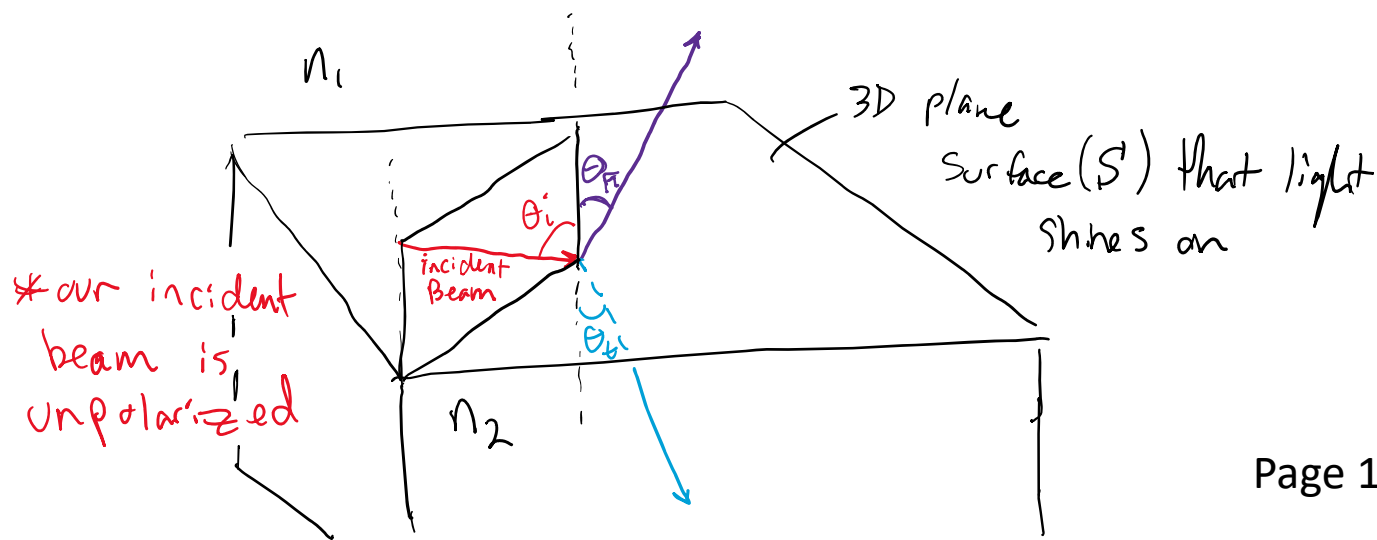

(LED) Laser Diodes

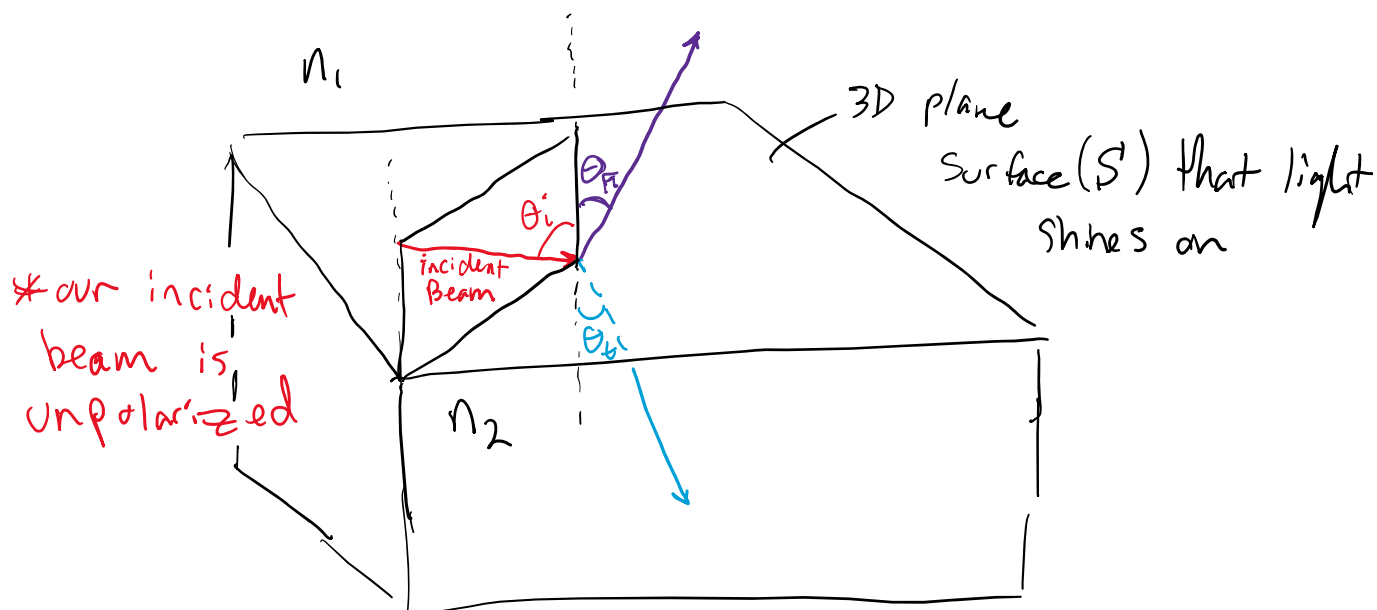

Unpolarized Wavelengths have a large output spectrum.
column of Light

- Sun
- incandescent (Lamps / bulbs)
- Plasmas

when θ_i becomes equal to a special angle ($\theta_{\text{polarization}} \rightarrow \theta_p$) the E-field of the light of both transmitted and reflected beams become polarized.

θ_p = Brewster's angle.

- The orientations of the polarized light is with respect to the plane of incidence. (very important concept).
